Figure 1: dN/dS **of autosomal (A) and X-linked (X) genes** Pairwise comparisons between members of three species lineages with violin plots of dN/dS values for X-linked and autosomal 1-to-1 orthologs. Permutation tests (n=10000, visualized with histograms, pink line shows measured median difference) show that dN/dS is significantly lower for X-linked orthologs in all comparisons within Bruchini (**A**), *Coccinella* (**B**), and *Tribolium* (**C**).
